Add Dense Layers:

This step is to add a dense layer (output layer) where you will be specifying thenumber of classes your dependent variable has, activation function, and weightinitializer as the arguments. We use the add () method toadd dense layers. the output dimensions here is 6.

```
model.add(Dense(40,
'relu'))
model.add(Dense(20,
'relu'))
model.add(Dense(6,
'softmax', ))
```
